Bharatiya Vidya Bhavan's SPJIMR

Enterprise IT

Date: 10-02-2026

Sessions Coverage themes

- Module 1 - Business Process Management
  - Introduction, Process Identification & Process Selection
  - As -is Process Modeling, Gap Analysis and Process Improvement
  - Modeling To-be process
  - Process KPIs - Monitoring and Control
- Module 2 (Prof. S. Jha)
  - Vendor Management Framework
  - RFI v/s RFP
  - Build v/s Buy
- Module 3 (Prof. A. Divatia)
  - IT Project Management
  - Stakeholder Analysis & Management
  - Change Management

© 2024 Jyoti Jagasia

Evaluation Components & Marks

Component	Weightage
Class Participation	**10%**
Quizzes (2)	**20%**
Group Assignment (2)	**30%**
End term exam	**40%**
Total	**100**

© 2024 Jyoti Jagasia

Agenda for today

- Introduction to BPM and BPM lifecycle
- Stage 1 – Process Identification
- Stage 2 – Process Discovery
- Case Introduction
- Task 1 and 2

© 2024 Jyoti Jagasia

Introduction to Business Process Management

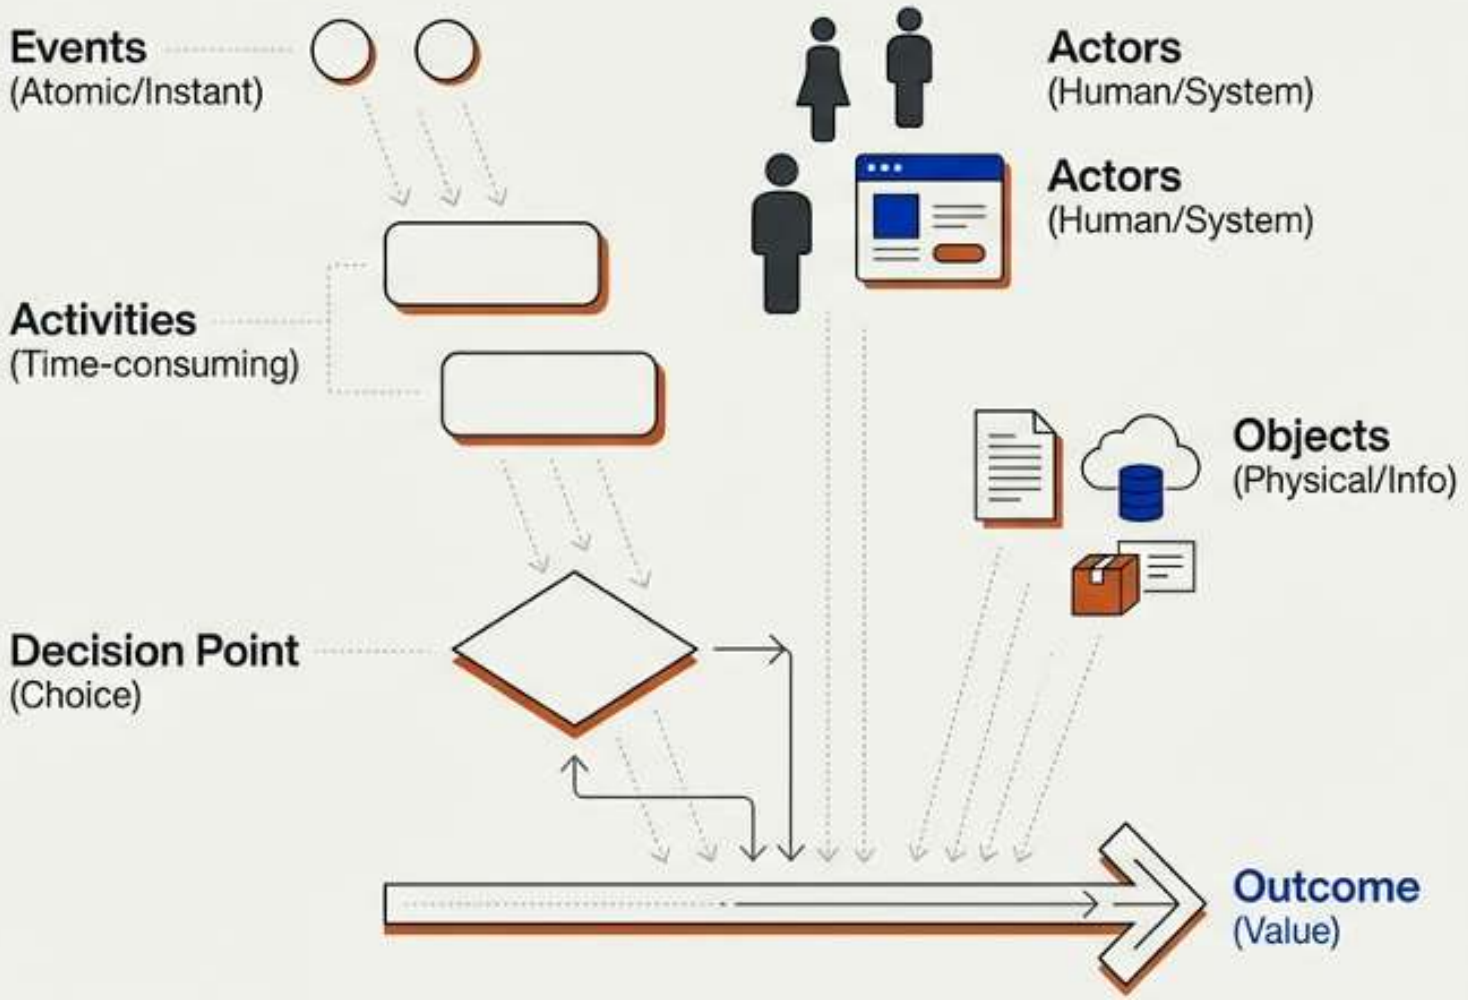
What is a business process?

© 2024 Jyoti Jagasia

A business process is a collection of events and activities that deliver value.

A process is not just "work." It is a specific collection of inter-related events, activities, and decision points involving various actors and objects. Crucially, a process must collectively lead to an outcome that provides value to at least one customer.

The Ingredients of a Process



Example of a business process

- If food arrives late, **the problem is rarely one person, i**t's usually the **process**.
- BPM focuses on **fixing the flow**, not blaming individuals.

The industrial legacy optimised the task but fragmented the purpose.

Pre-Industrial

The Generalist Artisan.
One worker, end-to-end process.

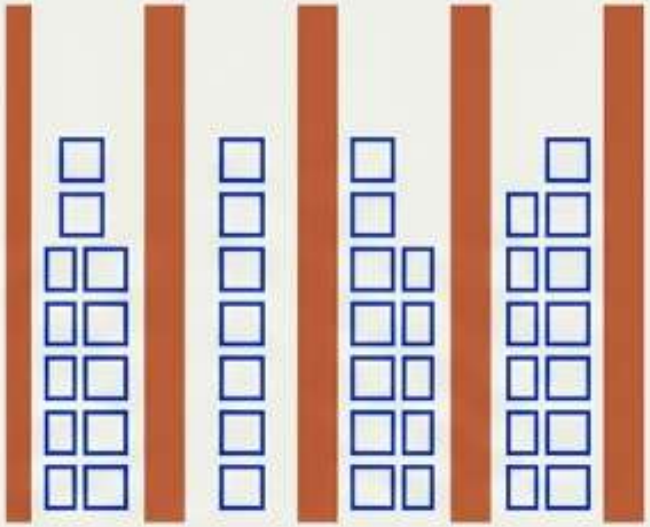
Craftsmanship era marked by single individuals overseeing the complete creation of a product, from raw materials to final goods. Purpose and task were intrinsically linked.

1776: Division of Labour

Adam Smith's Pin Factory.
Work broken into simple operations.

Smith's pin factory concept introduced task specialisation. Production efficiency increased by breaking down complex jobs into repetitive, isolated steps.

1900s: Scientific Management



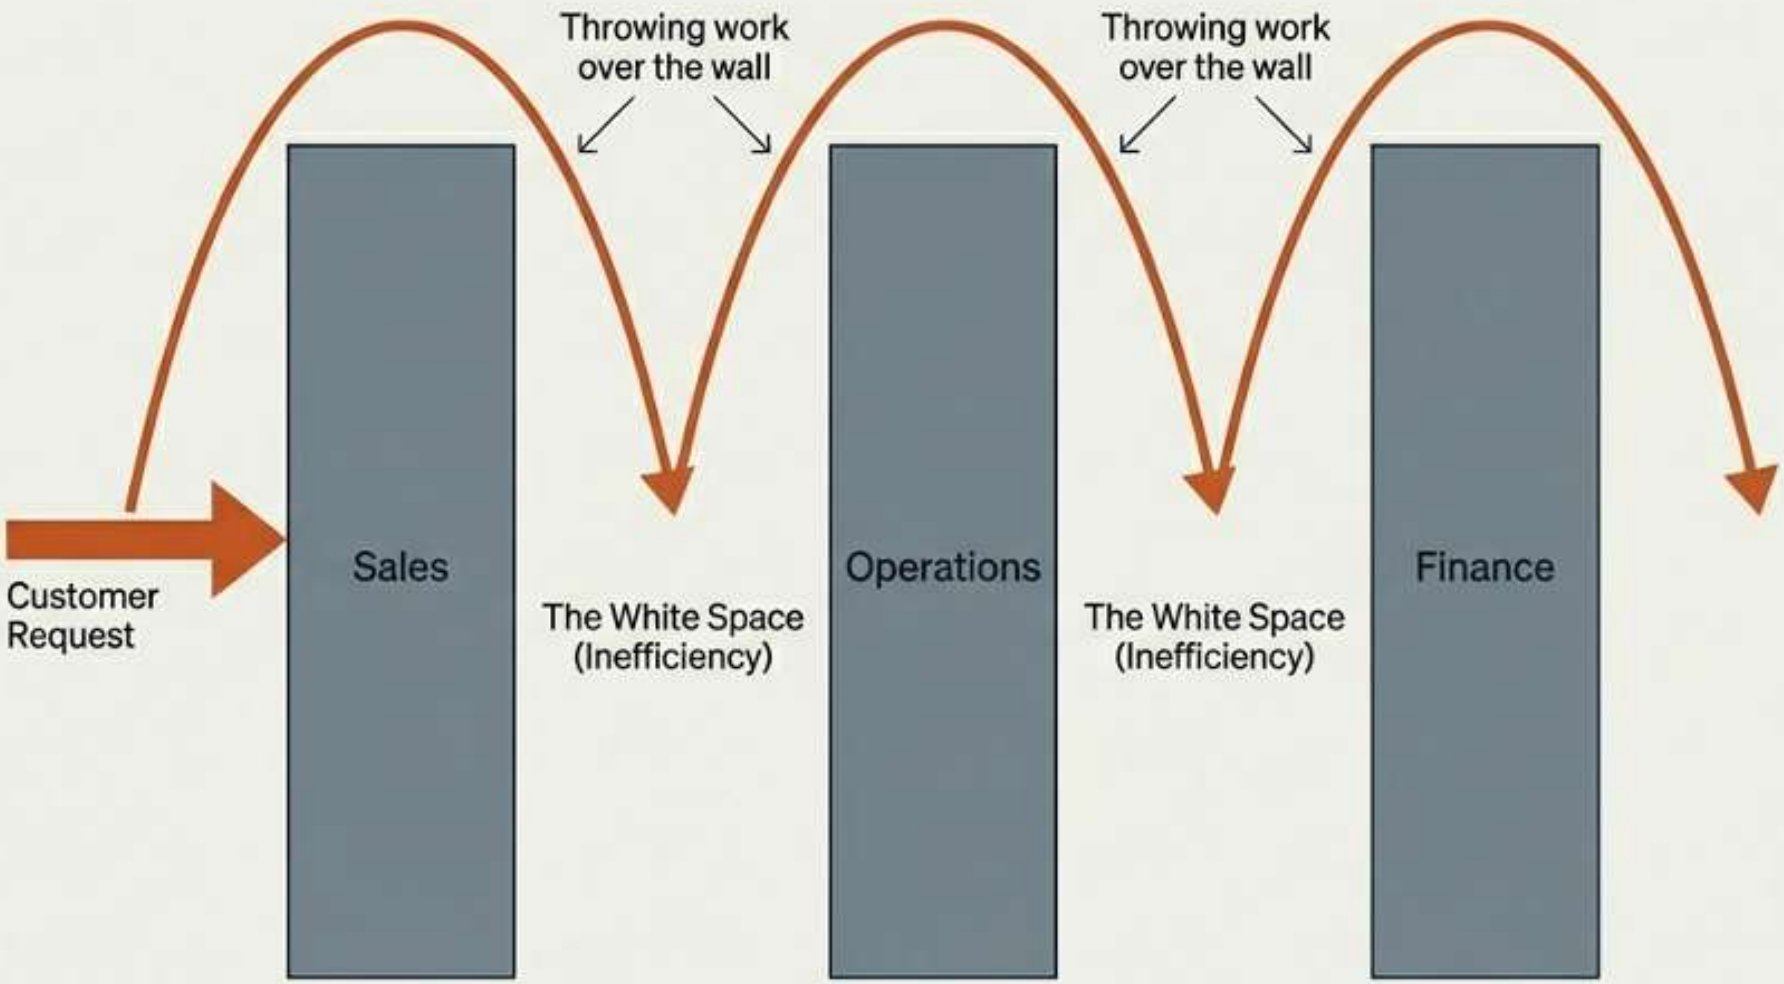
Taylorism & Functional Silos.
Optimised departments, fragmented flow.

Frederick Taylor's methods maximized efficiency within functions, creating isolated departments. This led to optimized local tasks but disconnected the workers from the overall process and purpose.

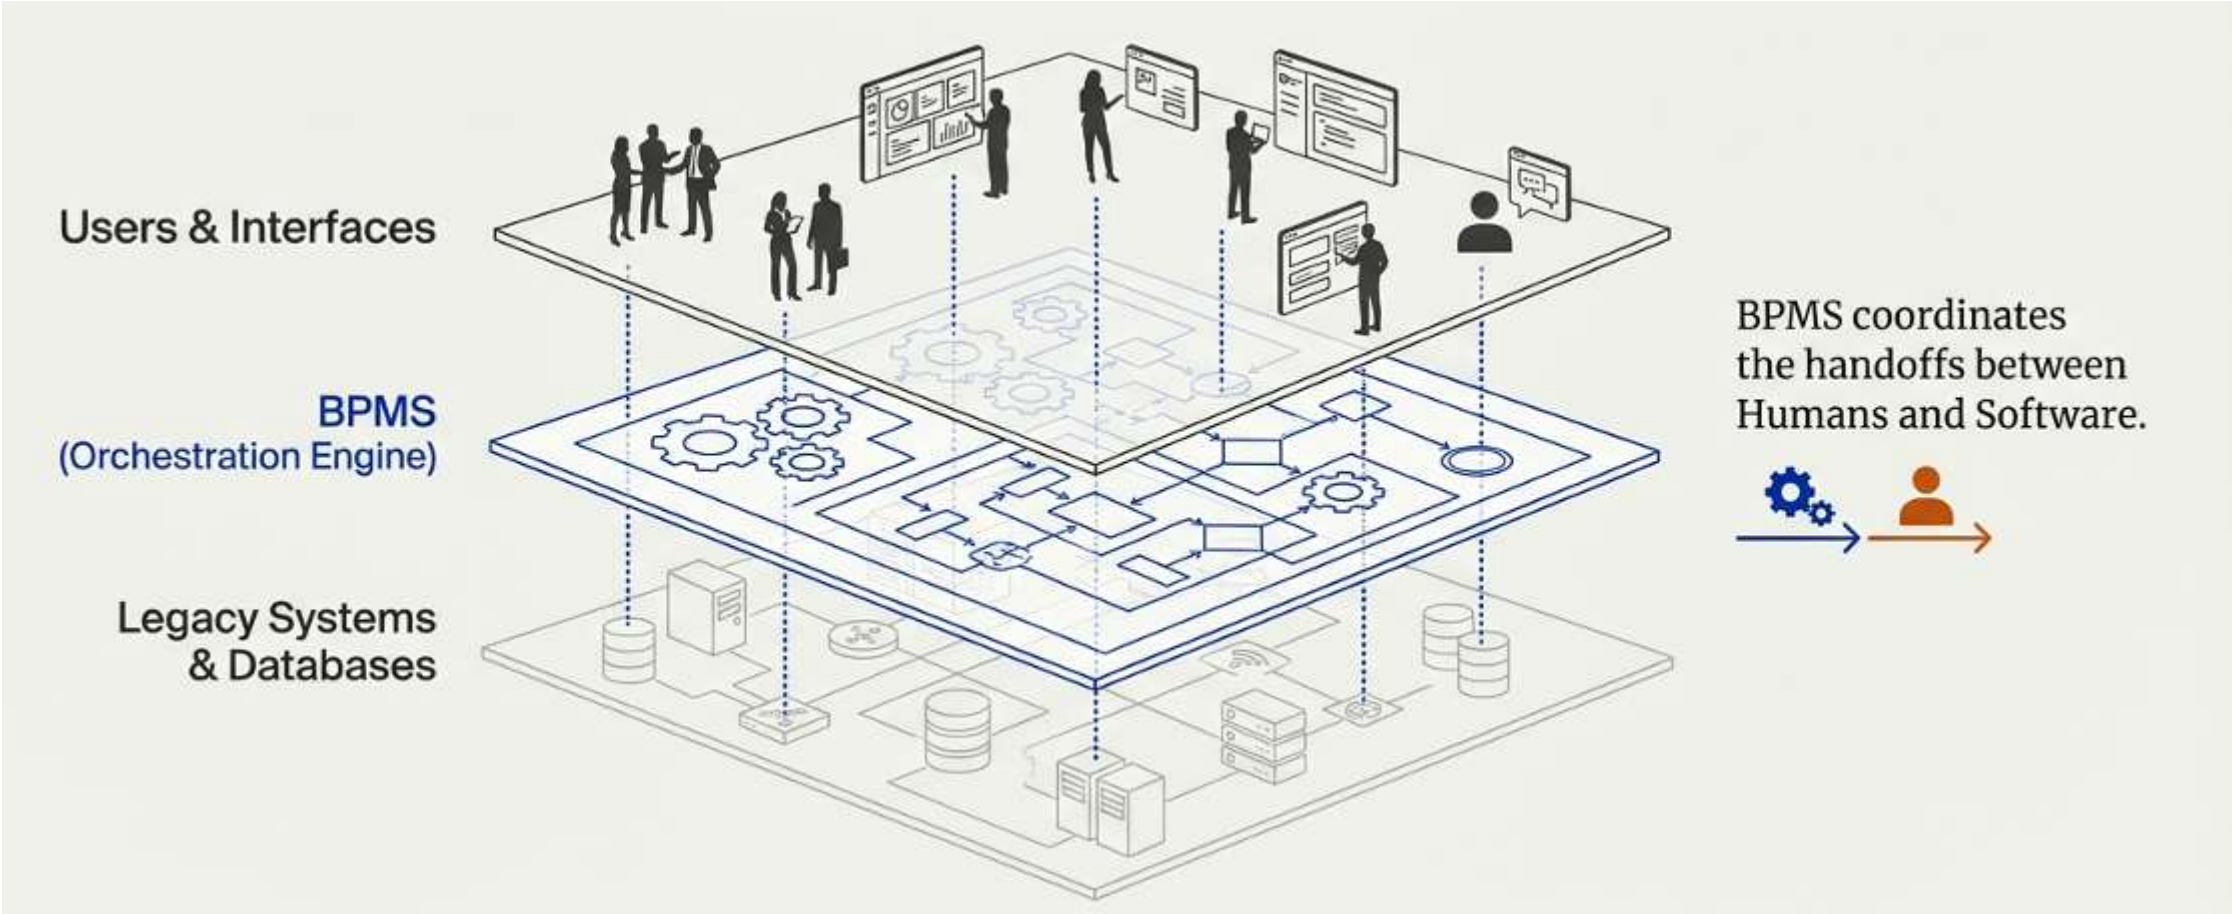
Functional optimisation creates delays in the 'white space' between departments.

By the 1980s, giants like IBM and Ford realised that while while individual departments were efficient, the overall company was slow.

This was the "Silo Trap." Work would be thrown "over the wall" from one department to another.

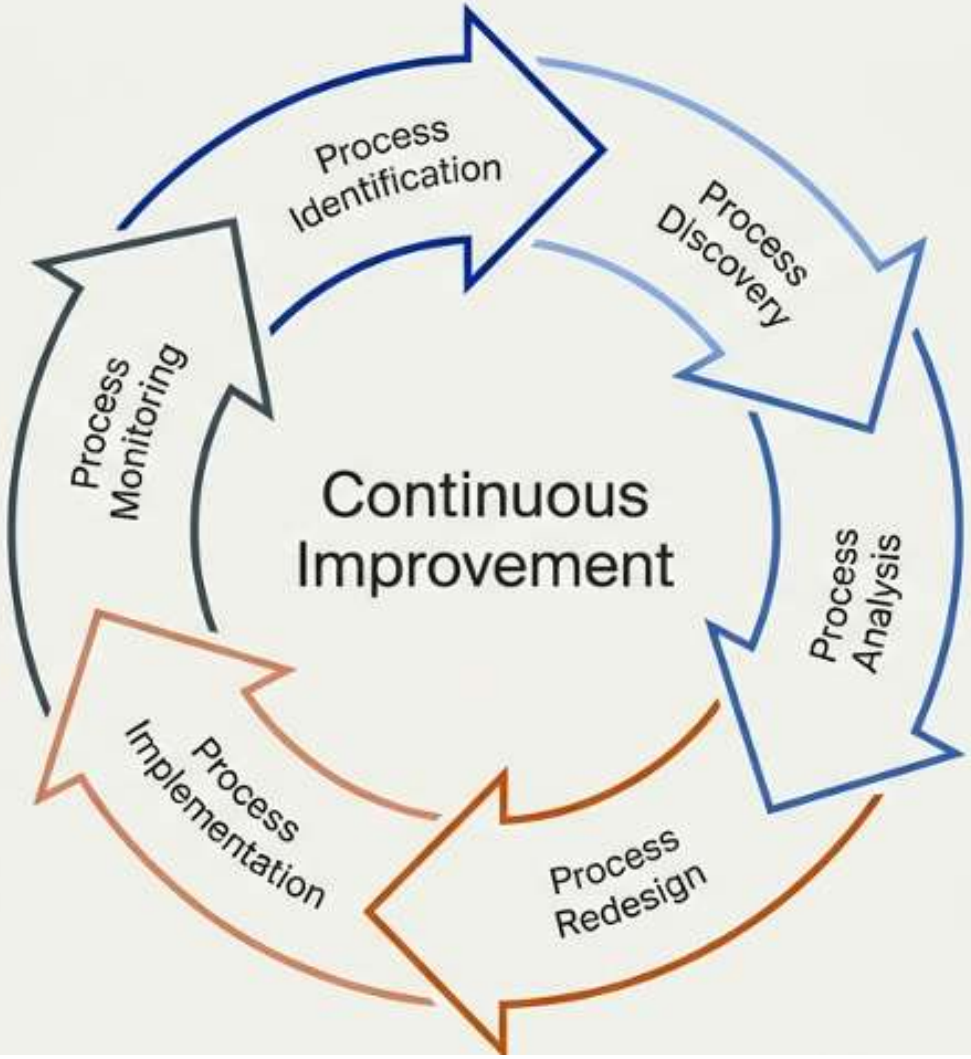


Technology has evolved from routing documents to orchestrating complex interactions



Optimisation is a continuous journey, not a one-time project.

Modern BPM employs a continuous lifecycle approach.



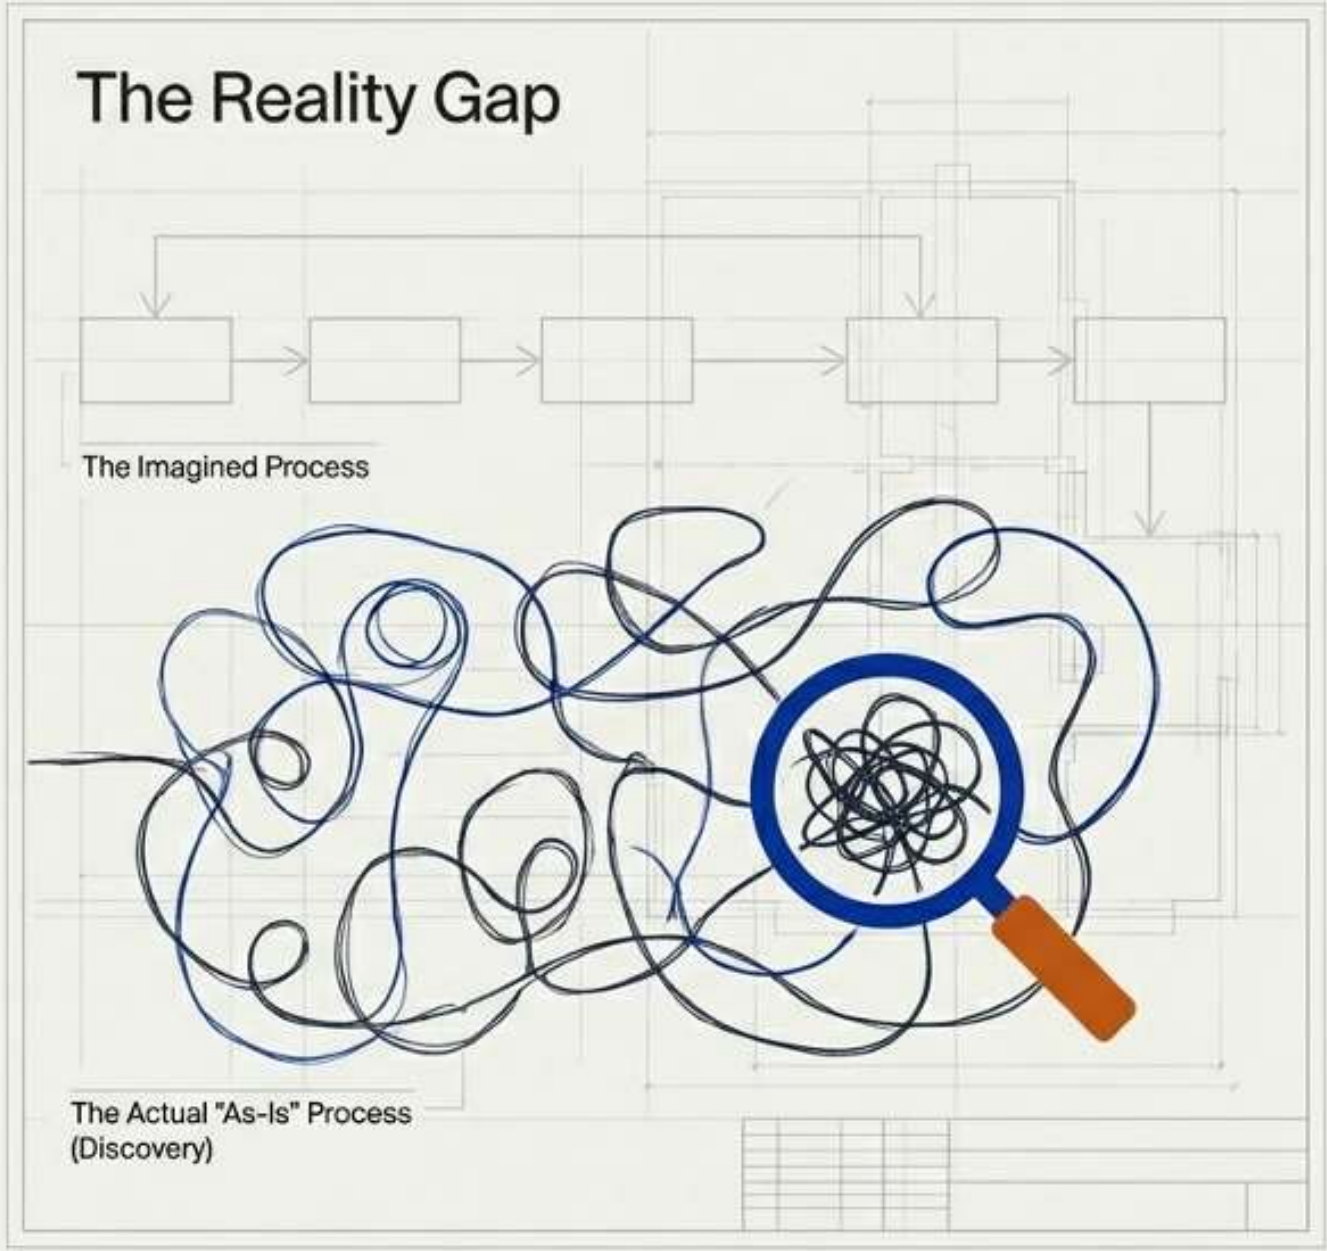
Phases 1 & 2: You cannot fix what you cannot see.

Process Identification:

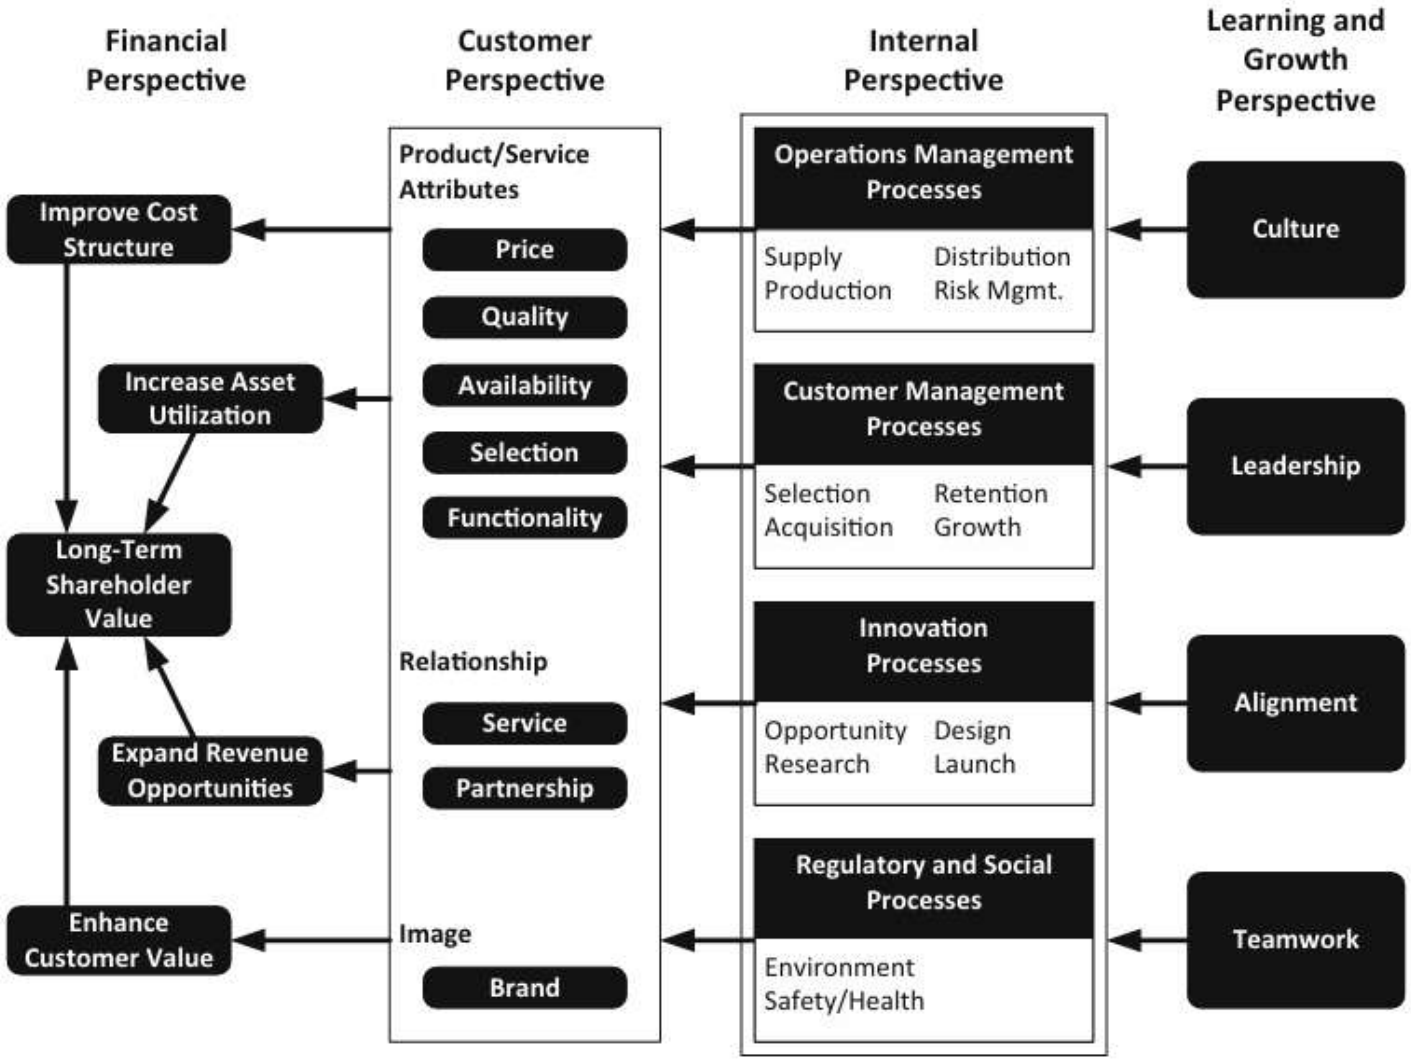
Defining the Process Architecture—a map of processes and their relationships based on business goals.

Process Discovery:

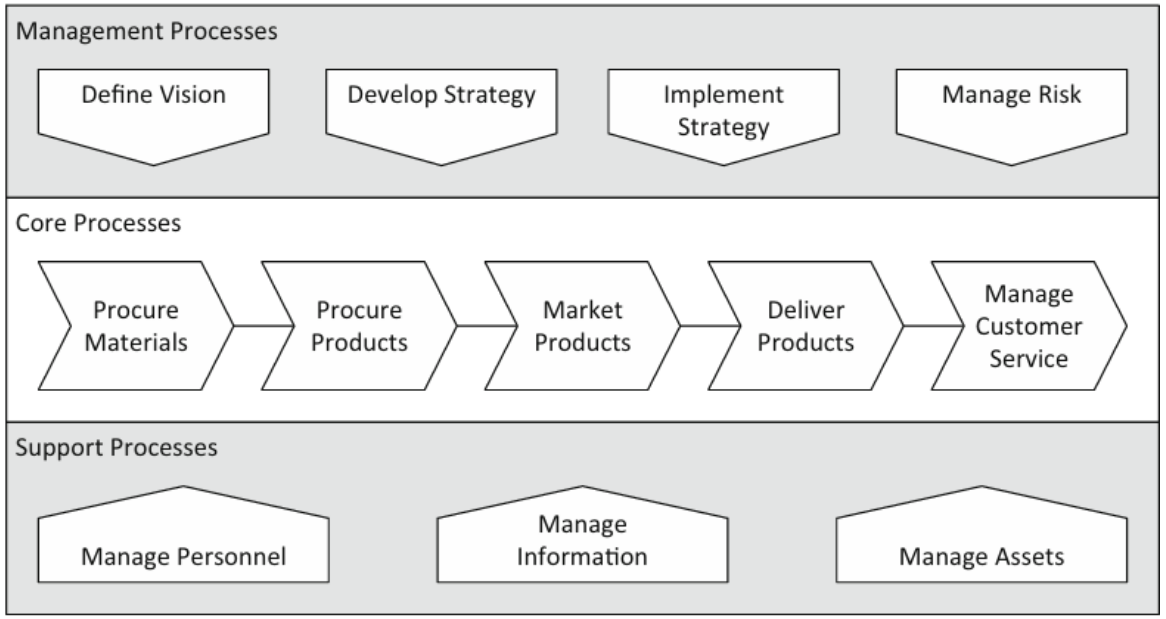
Documenting the “As-Is” state. Analysts interview domain experts to reveal reality vs. the “imagined process”.



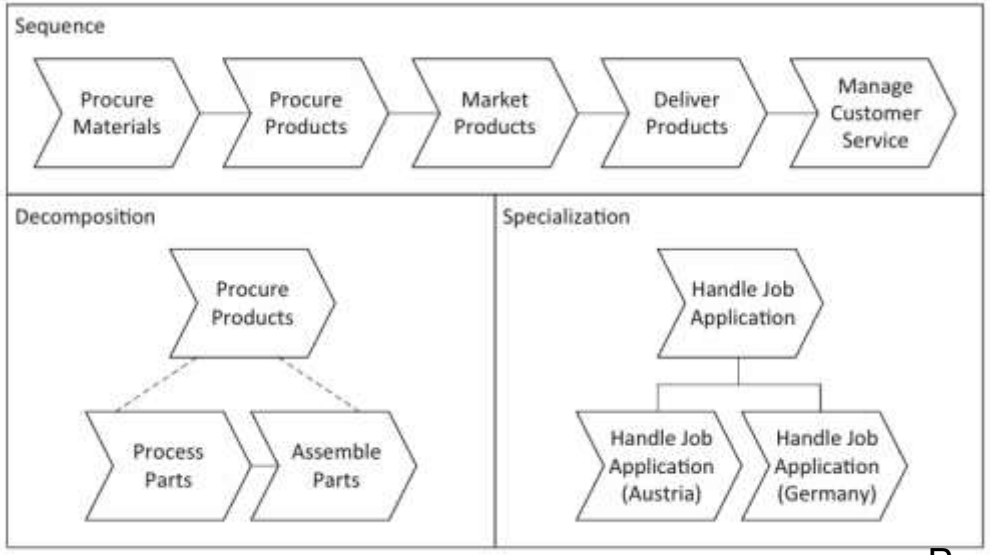
Process Identification



Process Architecture - representation of the processes that exist in an organization

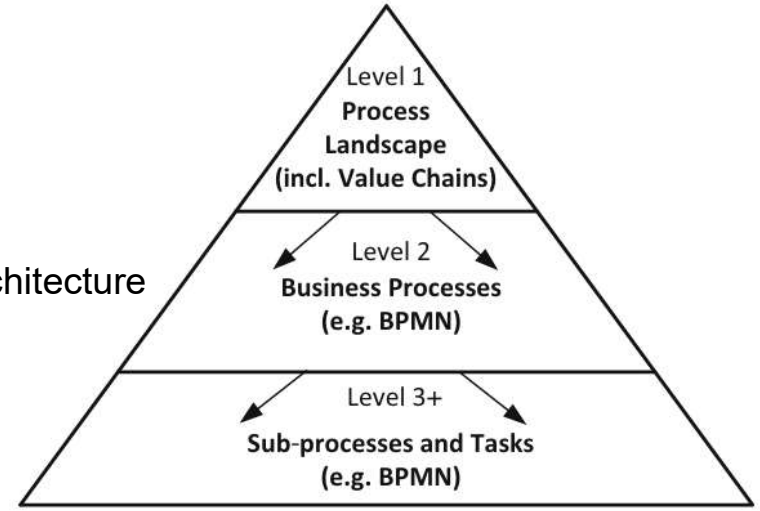


Process Categories for a Mfg. organization



Process Relationships

3 level Process Architecture



Process Discovery - It answers ‘what problem are we solving?’

Stakeholder Identification	Week 1	Identify all affected parties, map influence/interest
Current State Analysis	Week 1-2	Document As-Is processes, pain points, data flows
Requirements Gathering	Week 2-3	Interviews, workshops, surveys, document review
Future State Design	Week 3-4	Define To-Be processes, gap analysis, prioritization
Solution Blueprint	Week 4-5	HLD document, BRD sign-off, implementation roadmap

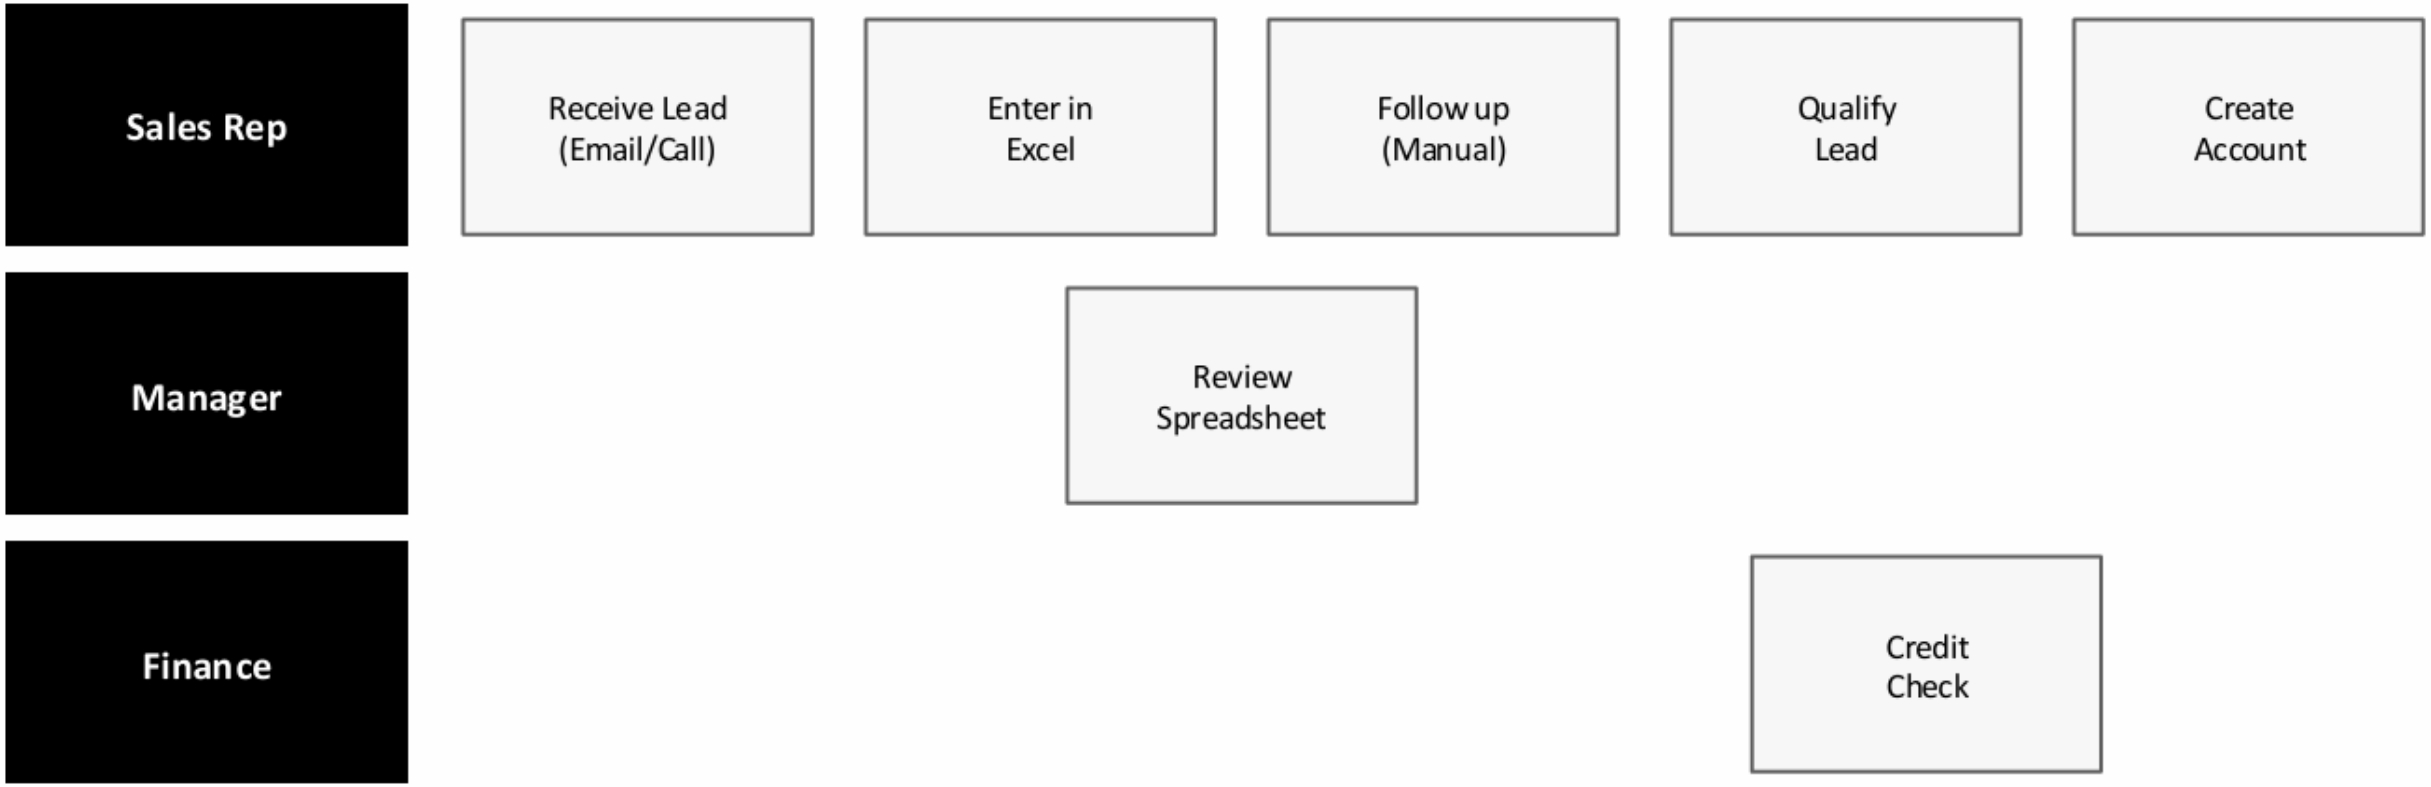
Discovery Techniques - Multiple techniques ensure comprehensive requirements capture

1. Stakeholder Interviews **1:1 with key users**	Output: Pain points, wish list, constraints	Tip: Ask 'why' 5 times to find root cause
2. Process Workshops **Group sessions**	Output: As-Is workflows, handoff points	Tip: Use sticky notes on whiteboard
3. Document Review **Before interviews**	Output: Current reports, forms, policies	Tip: Understand context before asking
4. Shadowing/Observation **Day-in-life**	Output: Actual vs stated process	Tip: Watch, don't just listen
5. Data Analysis **Validate claims**	Output: Metrics, volumes, trends	Tip: Numbers reveal the real story

Documenting workflows : As-is Process – Example

A workflow diagram captures WHO does WHAT, WHEN, and with what INFORMATION.

Lead Management – Current State (As-is)

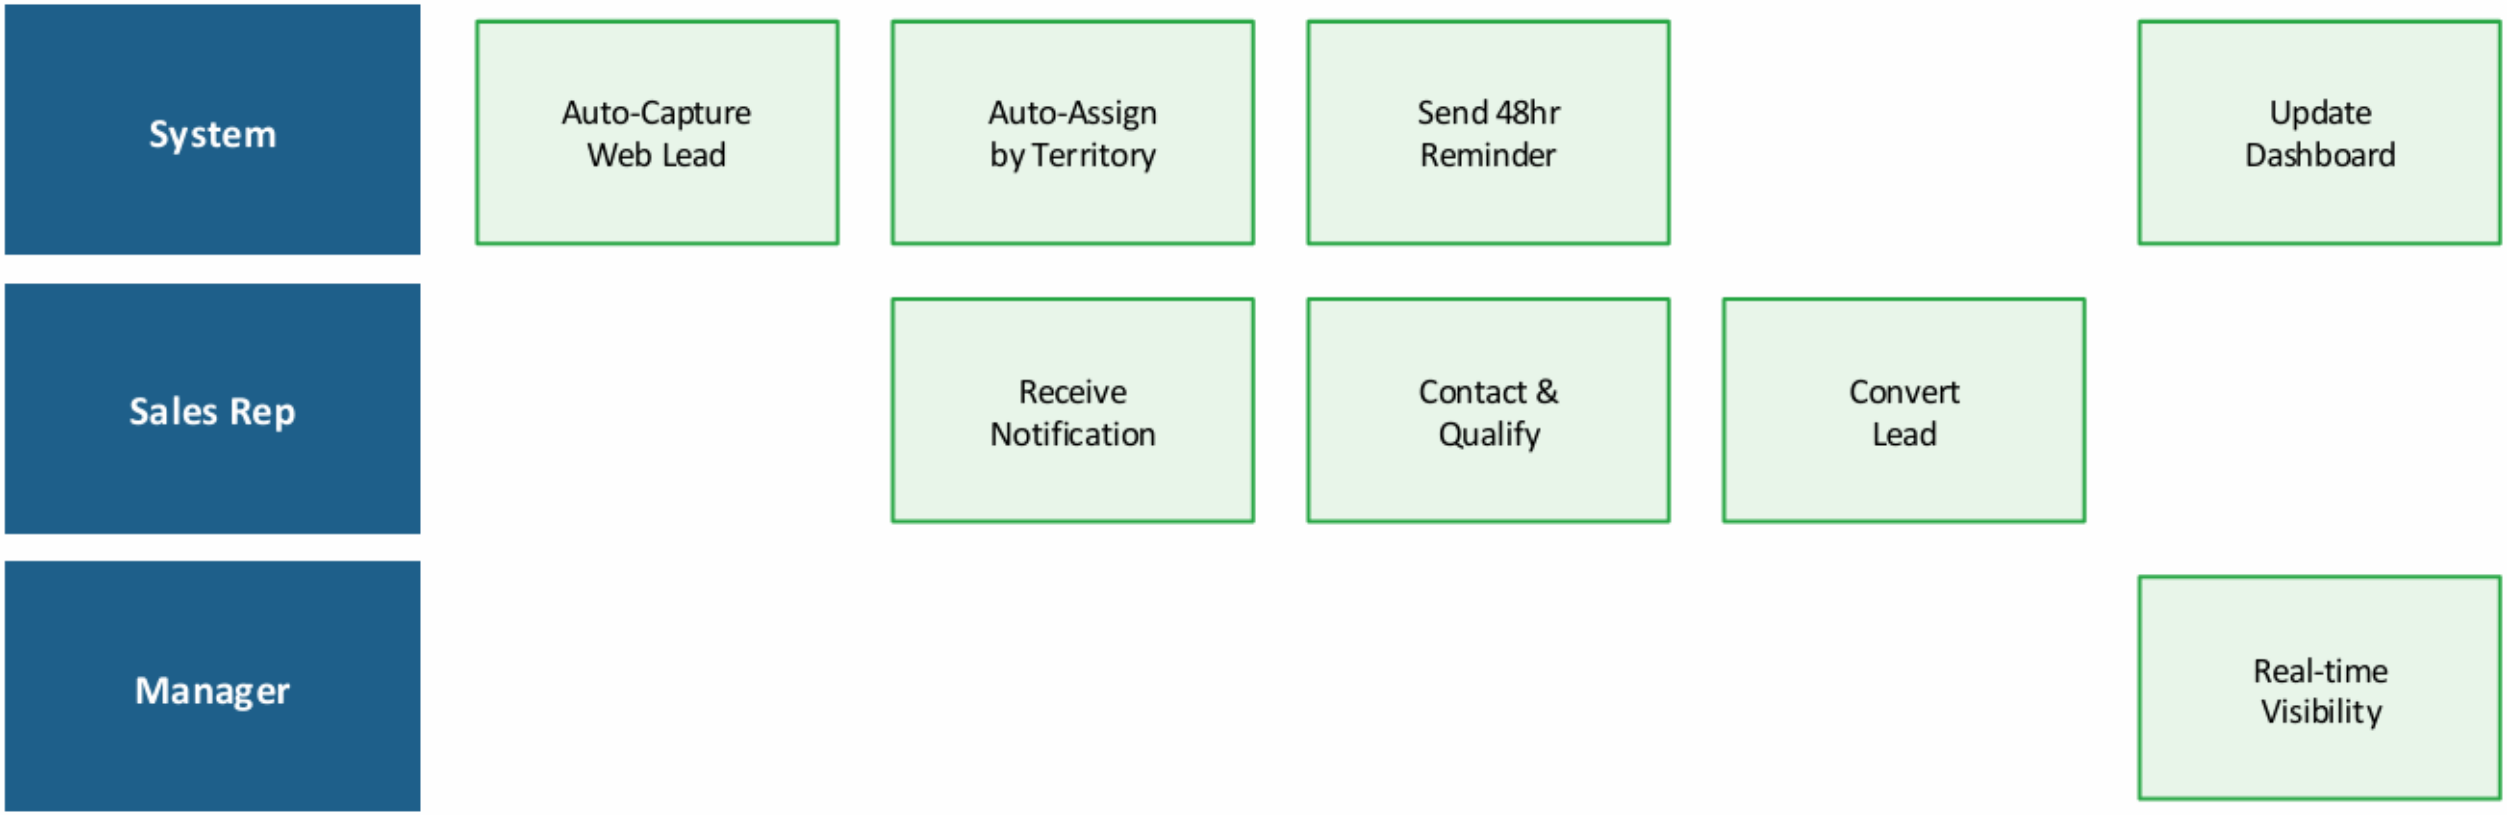


Pain Points: Manual entry errors | No reminders | 30% leads forgotten | No visibility | 3-5 day delays

Documenting workflows : To-Be Process - Example

A workflow diagram captures WHO does WHAT, WHEN, and with what INFORMATION.

Lead Management – Future State (To-Be)



Improvements: Auto-capture | Auto-assign | Reminders | One-click convert | Real-time dashboards

Sample Business Requirements Document

The BRD is the primary deliverable of discovery - it becomes the contract between business and IT.

1. Executive Summary

Business context, problem statement, solution overview

2. Stakeholder Analysis

Who is impacted, their needs, engagement strategy

3. Current State (As-Is)

Existing processes, systems, pain points, data flows

4. Future State (To-Be)

Target processes, CRM capabilities, improvements

5. Gap Analysis

Differences between As-Is and To-Be, actions needed

6. Functional Requirements

What the system must DO (MoSCoW prioritized)

7. Non-Functional Requirements

Performance, security, availability, integrations

8. High-Level Design (HLD)

Solution architecture, data model, security model

Gap Analysis – Bridging the As-is to To-Be - Example

Gap Analysis identifies what must change to move from current state to future state.

Capability	As-Is	To-Be	Gap / Action
Lead Capture	Manual email/Excel	Web-to-Lead, Mobile	Configure forms
Lead Assignment	Ad-hoc by manager	Auto by territory	Define rules
Follow-up	Memory-based	Automated tasks	Build automation
Pipeline View	Monthly Excel	Real-time dashboard	Create reports
Quotes	Word docs, 3-5 days	Product catalog	Setup products
Data Access	All see all	Role-based	Design security

Gap Analysis drives the implementation work breakdown and prioritization

Case Study - Transforming Employee Performance Through Business Process Management

4.1 Orientation Task: Setting the Context

After reading the case study, summarize the case in your own words.

- What is the case about?
- How does process orientation and BPM play a role here?
- Why is digital transformation crucial for Sannali? What outcomes can they expect, and what potential challenges or barriers might they face in the process?

Group Exercise – Task 1 and 2 of Case study

4.2 Task 1: Process Identification

- Develop a process architecture for the HRM processes at Sannali by identifying and referring to useful resources.

  Hint: Begin by mapping the current hierarchy of processes. Then, use additional reference materials, such as the APQC process frameworks, to identify additional areas that Sannali could explore to enhance its HRM processes.
- Analyze the role of IT in each HRM process, identify the relevant systems for each process area, and evaluate strengths and weaknesses in achieving process goals.

4.3 Task 2: Process Selection

In the process identification phase of the BPM lifecycle (as explained in Dumas et al. (2018), firms, typically, need to systematically screen and select the processes which should undergo process improvement efforts. At Sannali, the owner had decided to focus on the operators' performance management process.

- How do you justify the selection of the operators' performance management process?
